Glossary

The online guide is available for the latest platform changes.

01 · START HERE

How MarketMind works

A strategy creator (the app calls them the provider) runs their trading rules, usually through an AI agent. Each setup that appears is published as a signal. You subscribe to the strategy, and the signal reaches you in three ways.

App UI screenshot using a demo account. Names, figures and prices are examples, not customer data or a pricing offer.

The full steps are on the next page.

HOW MARKETMIND WORKS

Follow the steps

1 Pick a strategy and subscribe

Check its track record in **Marketplace**, then subscribe. From then on the Entry, SL and TP of every signal are open to you.

2 Connect Telegram

So a new signal lands in your chat without you opening the app.

3 Choose how to copy

Copy the levels to your broker yourself, or connect an MT5 account and have the orders placed for you (auto-execute).

Good to know

- Signing up is free. What you pay for is a subscription per strategy (priced by its creator), auto-execute per MT5 account, and an AI Agent if you want to build a strategy of your own.
- Signals are informational, not financial advice. Auto-execute places real orders on the broker account you connect.

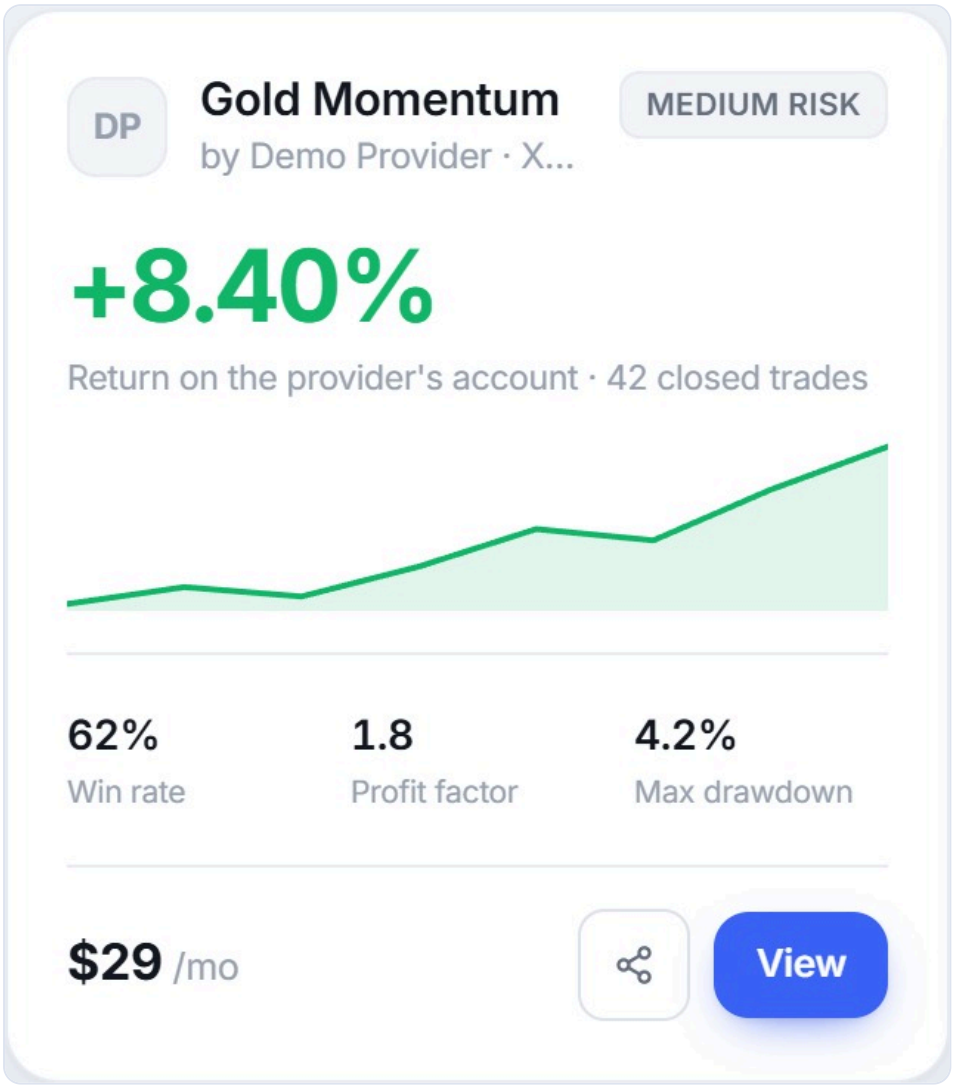

Open Marketplace ↗

Open this section in the online guide

02 · FOLLOWING A STRATEGY

Reading a strategy

Each card in **Marketplace** is one strategy. Its figures come from the creator's simulated account: every signal they publish is mirrored onto that account, and its balance curve is the track record you see.

App UI screenshot using a demo account. Names, figures and prices are examples, not customer data or a pricing offer.

The full steps are on the next page.

READING A STRATEGY

Follow the steps

1 Filter and sort

Filter with **All risk**, **Medium** or **High**. Sort through **Sort by**: **Return**, **Win rate**, **Profit factor** or **Most copied**.

2 Read the big number

The large percentage means **Return on the provider's account**. If it says **Building its track record**, the strategy has no closed trades yet.

3 Look at the followers' figures

When present, the lower panel shows **Copying** (accounts copying it), **Capital copying** (the money following), **Profit by copiers** (what followers have made) and **In market now** (trades currently open).

4 Open its page

Press **View**. Inside are the chart, the list of signals, the latest signal, the **Subscription** panel and the full **Track record** with its balance curve.

Good to know

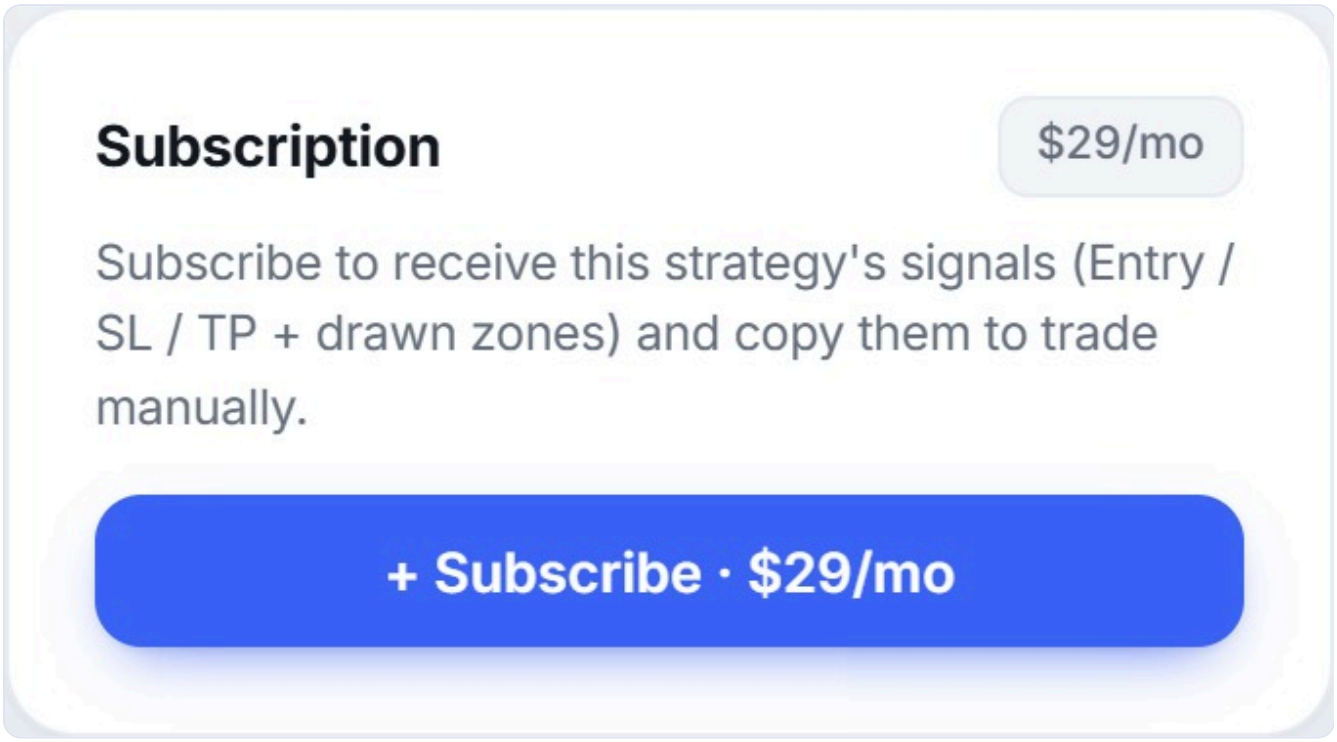

- Without a subscription you can still see the track record, the statistics and the signal history. Only the levels of signals that are still active are locked.
- Every strategy is labelled **EXPERIMENTAL**. Past performance is not a guarantee of what comes next.
- Win rate, Profit factor and Max drawdown are explained in the Glossary.

See strategies ↗

Open this section in the online guide

How to subscribe

Subscribing opens the Entry, SL, TP and drawn zones of one strategy. The price is set by the strategy's creator and is printed on the button.

App UI screenshot using a demo account. Names, figures and prices are examples, not customer data or a pricing offer.

The full steps are on the next page.

HOW TO SUBSCRIBE

Follow the steps

1 Open the strategy

From **Marketplace**, press **View** on the strategy card.

2 Press the subscribe button

It reads **+ Subscribe** followed by the monthly price. Have a code? Fill in **Voucher code** first. Have referral balance? Tick **Use your $X referral balance**.

3 Pay

You are taken to the payment page. A free strategy or a 100% voucher is active at once, with nothing to pay.

4 Check the result

After paying you return to the strategy page. The button becomes **✓ Subscribed** and the Entry, SL and TP figures are visible. It can take a few seconds for the payment to register.

Good to know

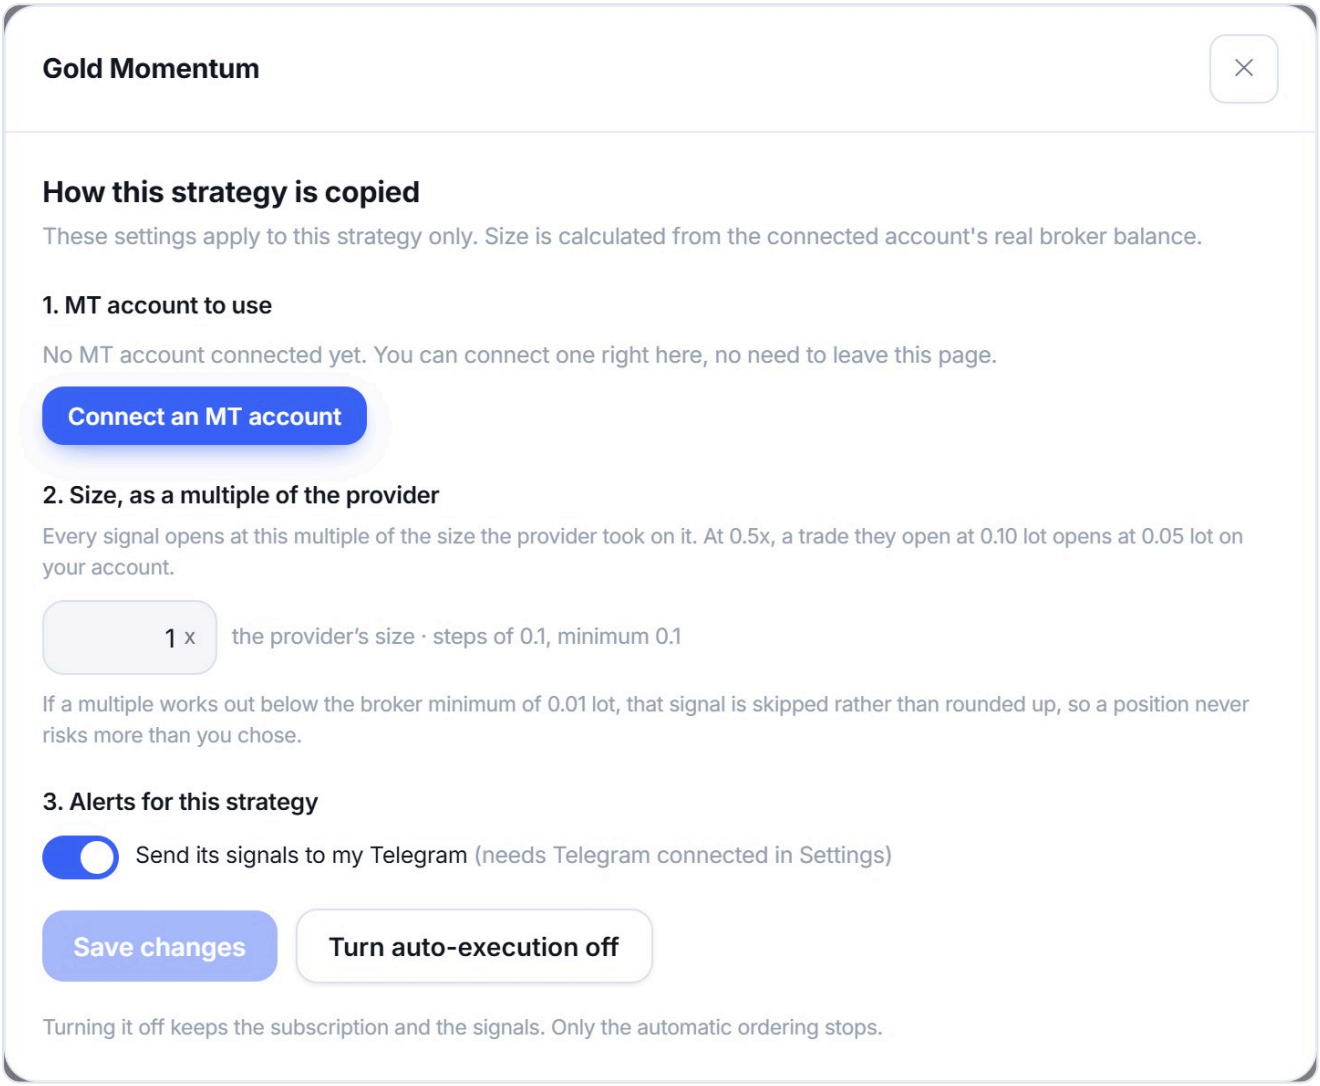

- One subscription lasts 30 days. Extend it with **Renew**; you can buy 1, 3, 6 or 12 months at once.
- Renewing early does not cost you the days you have left. The new days are added on top of the current end date.
- Stop any time with **Unsubscribe**, in the arrow menu beside **✓ Subscribed** or in the **Subscription** panel.
- During your account trial the button reads **+ Subscribe · free during trial**. That access ends with the trial unless you press **Subscribe now**.

Pick a strategy ↗

Open this section in the online guide

Setting up a strategy you follow

Once subscribed there are two ways to follow the signals. Manual: you copy the levels to your own broker. Auto: MarketMind places the orders on your MT5 account. The settings are per strategy and are called **Copy settings**.

App UI screenshot using a demo account. Names, figures and prices are examples, not customer data or a pricing offer.

The full steps are on the next page.

SETTING UP A STRATEGY YOU FOLLOW

Follow the steps

1 Manual: nothing to set up

Open the signal, press the **Entry**, **SL**, **TP** or **Lot** figure to copy it, and place the trade at your broker.

2 Auto: choose the account

In the **Subscription** panel on the strategy page, **Set up auto-execution** appears. Under **1. MT account to use**, tick the MT5 account to use. No account connected yet? Press **Connect an MT account** right there.

3 Set the position size

Under **2. Size, as a multiple of the provider**, enter the multiple. 1x means the same as the creator. At 0.5x, a trade they open at 0.10 lot opens at 0.05 lot on your account. The smallest value is 0.1, in steps of 0.1.

4 Turn it on

Press **Turn on auto-execution**. Not ready? Press **Not now**; you still receive the signals and can turn auto-execute on at any time.

5 Changing it later

Open **Settings**, the **Your subscriptions** section, then **Copy settings** on the strategy. The Telegram alert switch for that strategy is there too. The label shows the current state: **Manual** or **Auto · 0.5x provider**.

Good to know

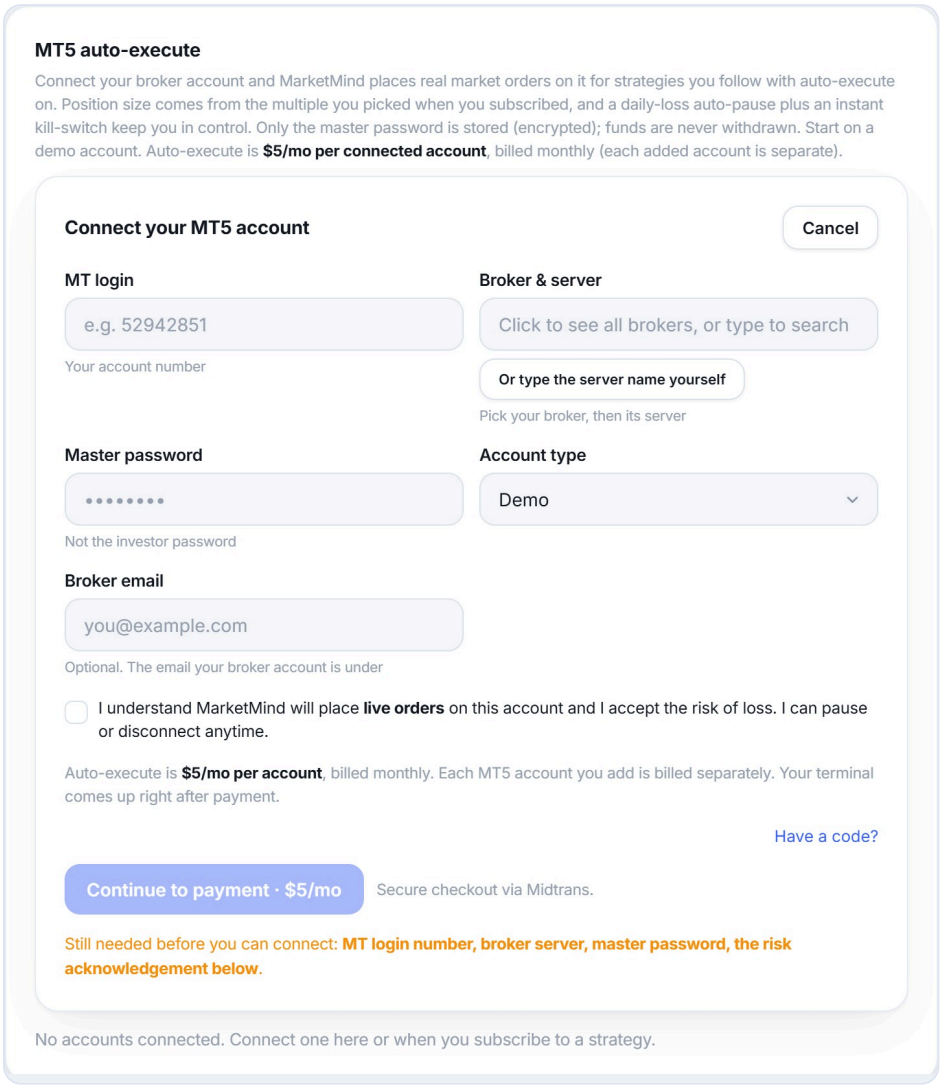

- The multiple follows the creator's size, not your balance. The same multiple can be light on one account and heavy on another. When you change a size on the strategy page, the **Apply these position sizes?** box shows the estimated risk per signal as a percentage of the account's balance. Read that figure before pressing **Yes, apply**.
- If a multiple works out below the broker's minimum lot (0.01), that signal is skipped rather than rounded up. A position is never larger than you chose.
- The number of MT5 accounts per subscription is capped by the strategy's creator. When you reach it, **Subscribe again** adds more accounts, billed separately.
- Turning auto-execute off does not end the subscription. Signals keep arriving; only the automatic ordering stops.

Open Settings ↗

Open this section in the online guide

Connecting an MT5 account

You only need this section if you use auto-execute. Your broker account is connected to MarketMind, and the order for each signal is placed there at the multiple you chose.

App UI screenshot using a demo account. Names, figures and prices are examples, not customer data or a pricing offer.

The full steps are on the next page.

CONNECTING AN MT5 ACCOUNT

Follow the steps

1 Open the form

Settings, the **MT5 auto-execute** section, then **+ Connect a broker account**.

2 Enter the account details

MT login is your account number. Under **Broker & server**, pick the broker and then its server. On a phone, tap **Add broker** to open a searchable list of brokers. **Master password** is the trading password, not the investor password. Choose **Demo** or **Real (live money)** under **Account type**.

3 Agree and pay

Tick the statement that real orders will be placed on this account, then press **Continue to payment**. Auto-execute is billed per account per month; the price is on the button.

4 Turn it on

Wait for the status **Connected**, then turn on the **Auto-execute** switch. The **● Live** badge means the account is ready to take orders.

Good to know

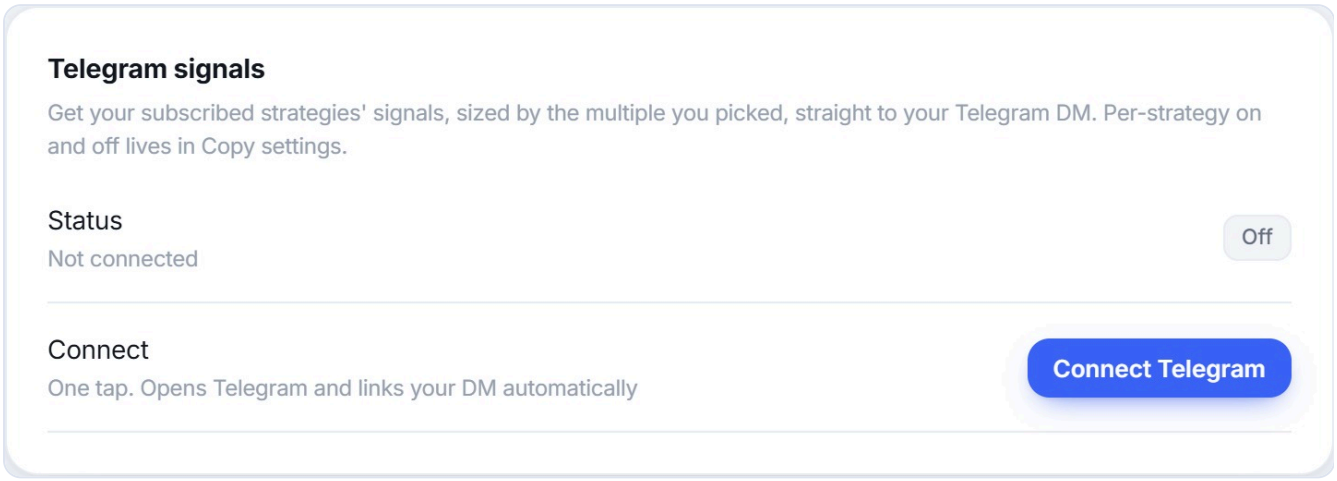

- Start on your broker's demo account. The **MetaQuotes-Demo** server is not supported.
- The server name is in your MT5 title bar or in the account email from your broker. If your broker is not in the list, choose **My broker is not listed, type the server myself**.
- **Daily loss** sets a daily loss stop: the account is paused for the day once its realised losses reach the amount you set.
- **Pause** pauses the account and **Resume** continues it. **Disconnect** stops its terminal and removes the account from MarketMind.
- The **● Not executing** badge means auto-execute is on but the terminal is not responding, so no order can be sent.
- There is no automatic renewal. The account card shows the days left, and **Renew** adds 30 days without losing what remains.
- Only the master password is stored, encrypted. Funds are never withdrawn from your account.

Connect an account ↗

Open this section in the online guide

How to connect Telegram

Once connected, every signal from the strategies you follow is sent to your private Telegram chat, with the lot size already adjusted to your multiple.

App UI screenshot using a demo account. Names, figures and prices are examples, not customer data or a pricing offer.

The full steps are on the next page.

HOW TO CONNECT TELEGRAM

Follow the steps

1 Open Settings

On a phone, press the **Profile** tab in the bottom bar. On a computer, open **Home** and press the **Settings** button at the top of the page.

2 Press Connect Telegram

The button is in the **Telegram signals** section. Telegram opens in a new tab or in its app.

3 Press Start in Telegram

That is all there is to do on the Telegram side. There is no code to copy.

4 Check the status

Go back to **Settings**. The status becomes **● Connected** followed by your Telegram username.

Good to know

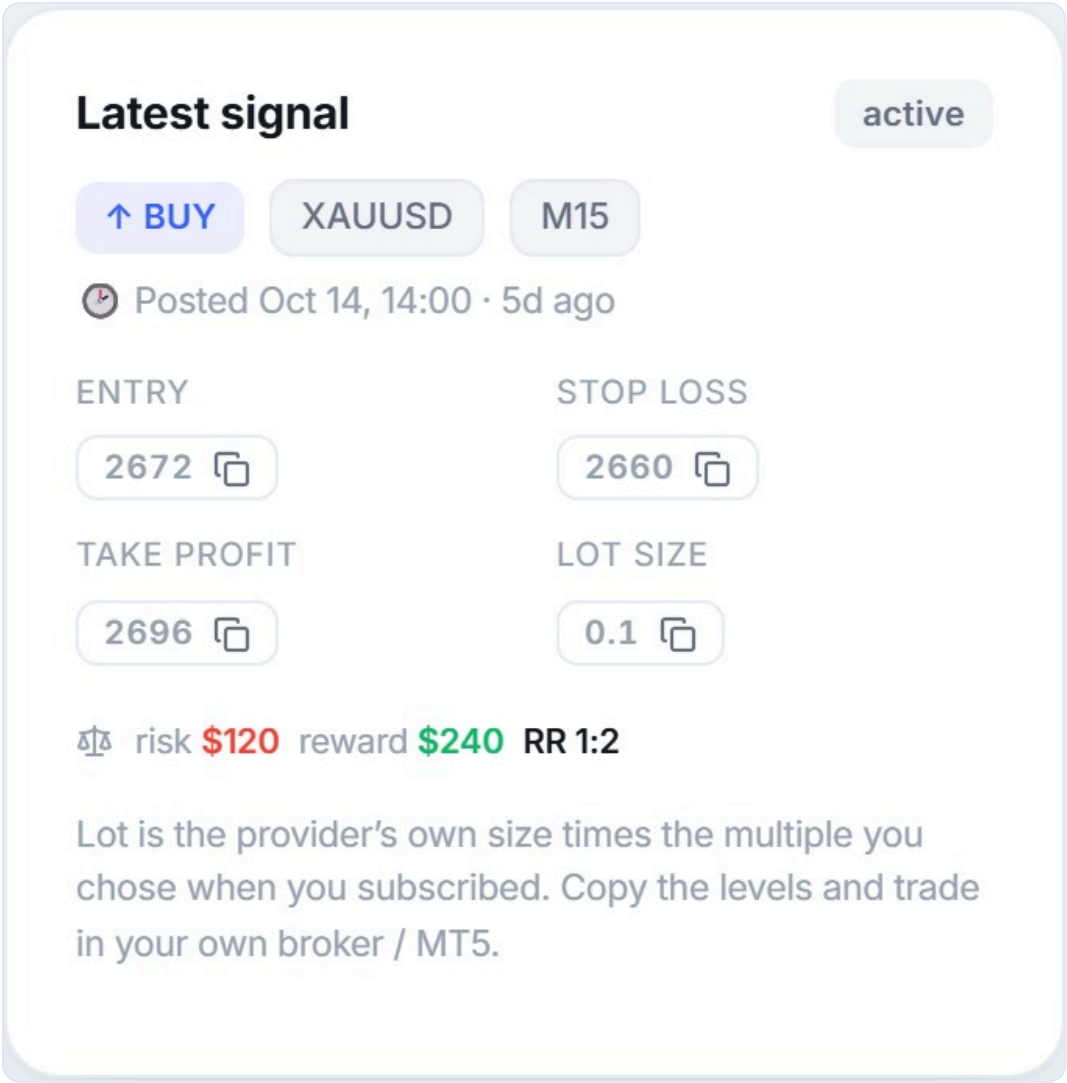

- One MarketMind account can be connected to one Telegram only.
- Alerts can be switched on or off per strategy with the **Telegram alerts** switch on the strategy page.
- If Telegram does not open after you press the button, allow pop-ups in your browser and try again.
- **Disconnect** breaks the link; signals stop going to Telegram but stay in the app.

Connect Telegram ↗

Open this section in the online guide

Reading a signal

A signal carries a direction (BUY or SELL), an **Entry** price, **SL**, **TP** and **Lot**. Its status changes with the price, from the moment it is posted until it is finished.

App UI screenshot using a demo account. Names, figures and prices are examples, not customer data or a pricing offer.

The full steps are on the next page.

READING A SIGNAL

Follow the steps

1 **New**

The signal is posted, but price has not reached Entry yet. On the strategy page it is under the **Active** tab.

2 **Entry**

Price has touched Entry and the trade is running. It is under the **Open** tab. A PNL figure with the circling mark is still floating and moves with the price.

3 **TP hit** or **SL hit**

The trade finished at the target or at the stop. It is under the **History** tab and its PNL is final.

4 **Invalid**, **Expired**, **Closed**

Invalid: the signal was cancelled before it filled, for example because price reached TP first. **Expired**: it never filled before it ran out. **Closed**: the strategy's owner closed it early. Invalid and expired signals are not counted in PNL.

Good to know

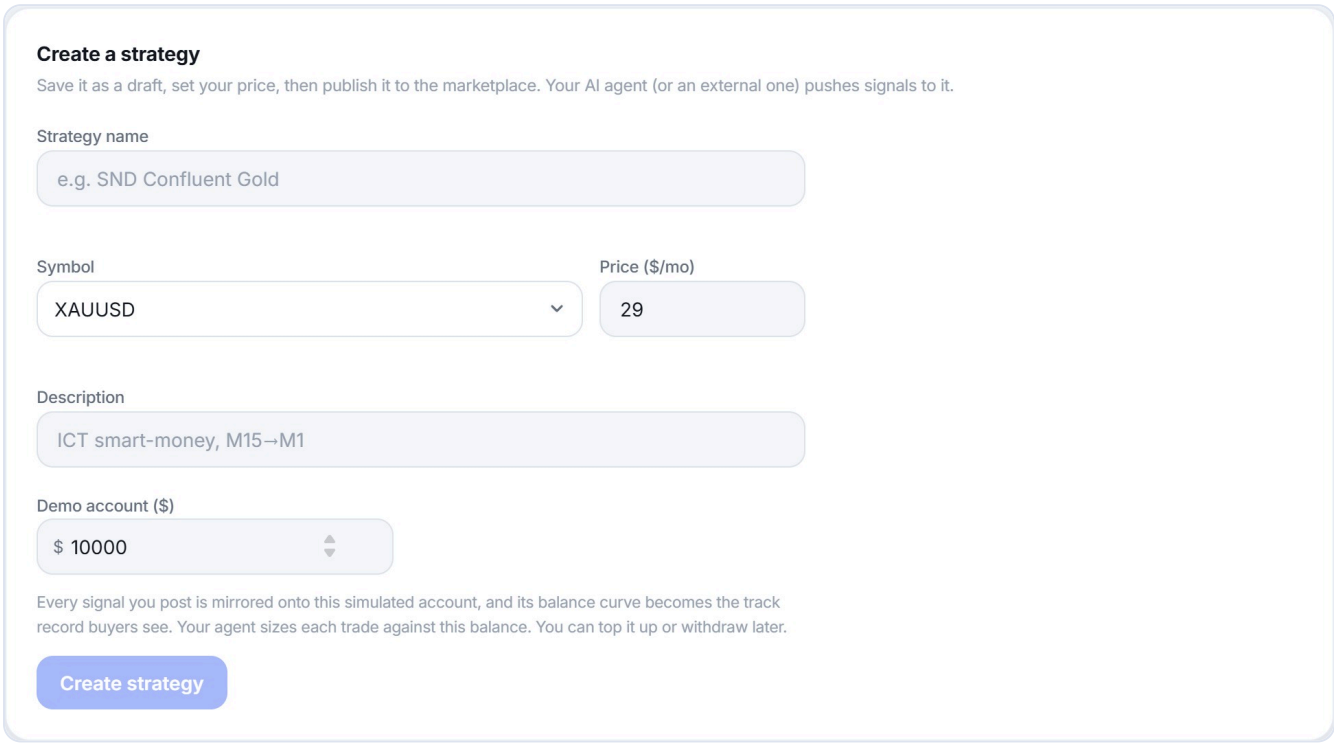

- The **Lot** shown is the creator's size times your multiple. Press the figure to copy it.
- The small line under the levels shows **risk**, **reward** and **RR**: what is at stake, what the target is worth, and the ratio between them.
- The **Signals** page gathers the signals of every strategy you follow. Filter by strategy, by period, or by **BUY** and **SELL**. **Export** downloads a **PDF document** or **Excel spreadsheet** report for the strategy and period on screen.
- **subscribe to unlock** means the levels are locked because you have not subscribed or the subscription has ended.
- A red dot on the **Signals** menu means there is a new signal.
- The PNL shown is an estimate at your multiple. The result on your broker account can differ a little because of spread and fill price.

Open Signals ↗

Open this section in the online guide

How to create a strategy

A strategy is the container of signals you sell in the Marketplace. You create it in **Agent Studio**, which opens once you have bought an AI Agent. The price is on its purchase button.

App UI screenshot using a demo account. Names, figures and prices are examples, not customer data or a pricing offer.

The full steps are on the next page.

HOW TO CREATE A STRATEGY

Follow the steps

1 Open the Strategies tab

Agent Studio has three tabs: **AI Agent**, **Strategies** and **Earnings**. Choose **Strategies**.

2 Fill in Create a strategy

Strategy name and **Symbol** are what buyers see. **Price ($/mo)** is the monthly subscription price. **Description** says briefly how it trades. **Demo account ($)** is the starting balance of this strategy's simulated account.

3 Save it as a draft

Press **Create strategy**. It appears under **Your strategies** with the status **draft**, and nobody else can see it yet.

4 Connect where its signals come from

With the built-in agent: open **Setup** on the agent, the **Rules** tab, and choose this strategy under **Live signals go to**. With an agent of your own: open **Connect an external agent (API)**, make a key with **Generate key**, and get **Download skill (.zip)**.

5 Publish

Press **Publish**. The status becomes **● published** and the strategy shows in the Marketplace. **Unpublish** takes it back down.

Good to know

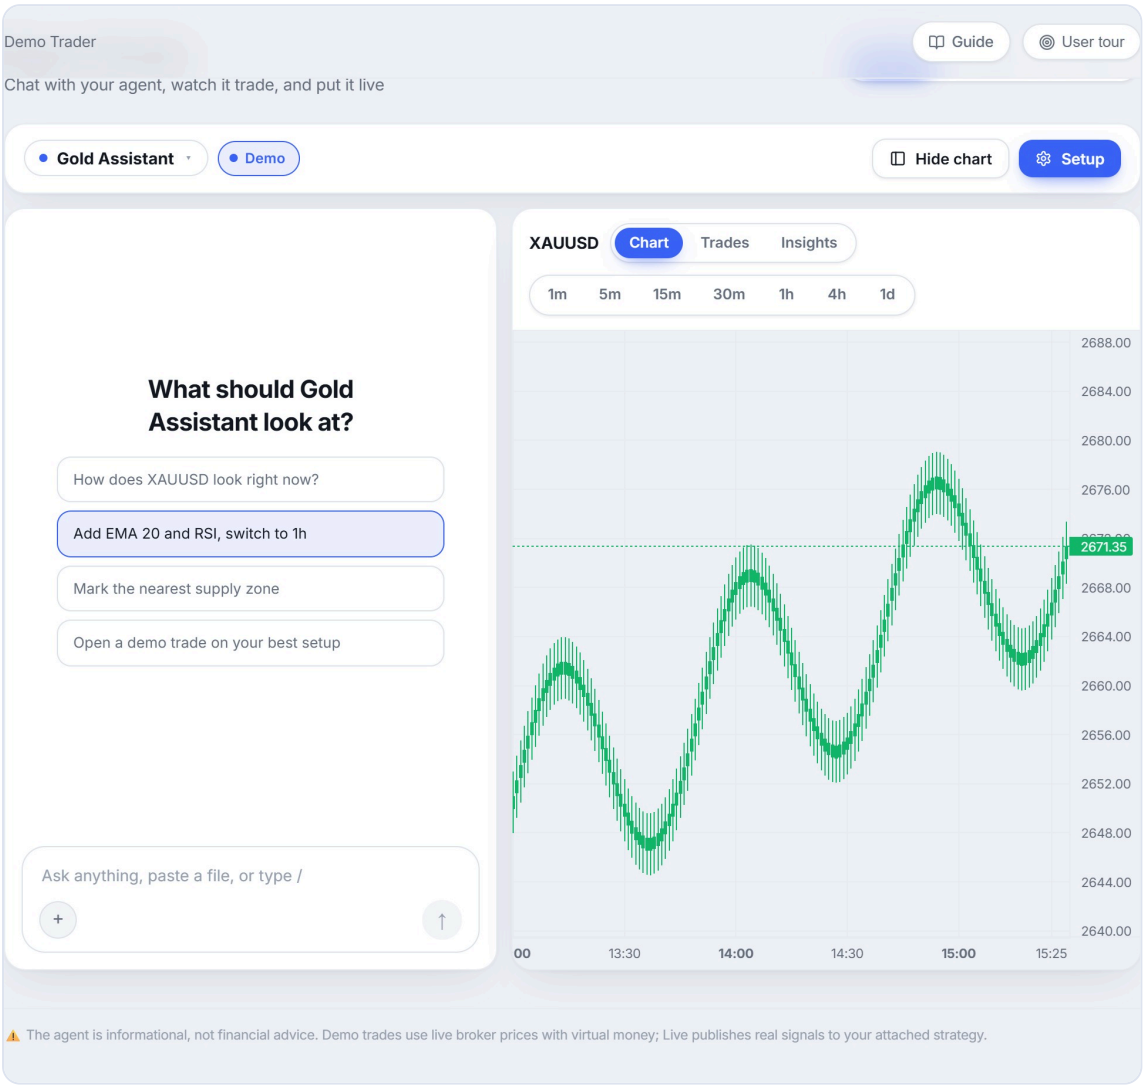

- Every signal you publish is mirrored onto the strategy's demo account, and its balance curve becomes the track record buyers see. The **Account** button opens that account; there you can **Top up** or **Withdraw** its simulated balance.
- **Brand** sets your name and logo on share cards and on the strategy's public page.
- **Referral** sets the commission for someone who brings a paying subscriber.
- **MT accts / follower** limits how many of one follower's MT5 accounts may run this strategy. 0 means no limit.
- The name and price can be edited right in the list. A strategy can only be deleted when it has no active subscribers.
- Earnings and withdrawals are under the **Earnings** tab. The platform's commission is stated there.

Open Agent Studio ↗

Open this section in the online guide

The running agent

An AI Agent is a program that analyses the market by your rules and keeps running on the server, including while your browser tab is closed. An agent feeds one strategy with signals.

App UI screenshot using a demo account. Names, figures and prices are examples, not customer data or a pricing offer.

The full steps are on the next page.

THE RUNNING AGENT

Follow the steps

1 Activate it

In **Agent Studio**, press **Unlock your AI Agent** or **Purchase**; the price is on the button. After payment the agent is started; it usually takes 15 to 45 seconds before you can chat with it.

2 Choose its brain

Open **Setup**, the **Model** tab. Use MarketMind's model (GLM, topped up with tokens) or connect your own Claude, ChatGPT, Grok or Gemini with an **API key** or through the **Connect** button.

3 Write its rules

On the **Rules** tab: write how it trades under **How it trades** and press **Save rules**, choose the target strategy under **Live signals go to**, and choose a schedule under **Runs on**. **M15 candle close** is the recommended choice.

4 Choose its mode

Paused: nothing runs. **Demo**: the agent trades a virtual account with live prices. **Live**: the agent publishes real signals to your subscribers. Change mode by typing in chat: "pause", "switch to demo" or "go live". The agent shows an **Approval needed** card; press **Approve**.

5 Watch it

Press the agent's name in the top bar to see when it last ran and when it runs next. In the right panel: **Chart** for its chart, **Trades** for the demo account's positions and history, and **Insights** for a performance summary.

Good to know

- Open **Run log** under the history on the **Trades** tab to see the decision of each run: **traded**, **no trade**, **skipped** or **error**.
- **Live** mode needs a strategy chosen under **Live signals go to**. For its signals to reach subscribers, that strategy also has to be published.
- The agent's monthly fee pays for running it. Model tokens are not included. If **Out of GLM tokens** appears, top up or connect your own model.
- A faster schedule uses more model quota. If one analysis is still running when the next one is due, that run is skipped.
- An agent can have its own Telegram bot: **Setup**, the **Telegram** tab, paste the token from @BotFather. To post signals to a group or channel, open the **More** tab.
- The agent works on its strategy's instrument: gold (XAUUSD), silver (XAGUSD) or one of the six major forex pairs (EURUSD, GBPUSD, USDJPY, AUDUSD, USDCAD, USDCHF). A strategy trades one instrument, chosen under **Symbol** when you create it.

Open Agent Studio ↗

Open this section in the online guide

REFERENCE

Glossary

Terms and abbreviations you will meet in the app.

Entry

The price to get in at. The trade only starts when price reaches this level.

SL (stop loss)

The exit price if the trade goes against you. The distance from Entry to SL sets how much is at risk.

TP (take profit)

The target price where the trade is closed in profit.

Lot

The position size. On MarketMind your lot is the creator's lot times your multiple.

Multiple

A number such as 0.5x or 2x that sets how large your position is compared with the creator's.

RR (risk reward)

The ratio of risk to target. RR 1:2 means the target is twice the stop distance.

Win rate (WR)

The share of closed trades that ended in profit. Read it together with Profit factor: a high win rate with large losses still loses money.

Profit factor (PF)

Total profit divided by total loss. Above 1 means it has made money overall; higher is better.

Max drawdown (Max DD)

The largest fall in balance from its highest point. It shows how deep the strategy has ever dipped.

Floating and realised PNL

Floating: the result of a trade still running, which moves with the price. Realised: the result of a trade that has closed.

Equity

The balance plus or minus the result of positions still open.

Provider

The creator and owner of a strategy.

Track record

A strategy's history, taken from its creator's simulated account, which mirrors every signal.

Auto-execute

The service that places the order for each signal on your MT5 account automatically.

Master password

The MT5 trading password, which can open and close positions. Not the investor password, which can only look.

Cent account (USC)

An account whose balance is counted in cents. The app shows the original figure together with its dollar value.

Token

The unit of AI model usage. Every analysis the agent runs spends some tokens.

> Signals are informational, not financial advice. Auto-execute places real orders on the broker account you connected. Past performance is not a guarantee of future results.
